

One Piece of Stormwater Management

In order to prevent flooding from the Lake and some Ponds we have a Stormwater Management Overflow device to maintain an acceptable, safe and normal high-water level. When the system exceeds approved levels, it can overflow and be discharged thru a structure as seen in the picture. This unit discharges to a protected nature preserve area. Ultimately stormwater travels by a tributary of the Braden River and onward thru Wards Lake to the Manatee River. This is why stormwater control is essential and must maintained and managed not only for our benefit but those downstream.
